

Violin Devices for Arm Amputees

Violin playing can be a fun and rewarding hobby for an arm amputee, provided you have the right device. This information sheet showcases two devices from TRS, as well as some custom devices.

The TRS **Violin Adaptor** screws into any standard prosthesis. The bow is held securely in place with set screws. This device is intended for beginner players.

The TRS **Violin 2** is a more advanced model. The bow is able to pivot easily, replicating natural wrist action and control. This device also screws into any standard prosthesis.

Below are a variety of custom devices. Your prosthetist can determine what type of device will work best for you.
